Dillingham Census Area, Alaska

COUNTY DATA BRIEF | Published response: Review level unavailable | Score 24.3 | FIPS 02070

Why it surfaced This county is outside the contiguous tick scope of the current release, so a review level is not assigned. This brief is for Dillingham Census Area, Alaska. Based on published Atlas gap-score category. This is not a model-assisted surveillance priority. The notes below describe the published county record. They do not show how much each field contributed to the gap score, and they are not a measure of individual risk.

County data / Six review factors

01 **Published Lyme case data**
No county-level 2023 Lyme case count was published. A missing record is not treated as zero cases.

02 **Tick presence**
The published tick status is Unknown. This is not a finding of tick absence.

03 ***Borrelia burgdorferi* detection**
No county-level *Borrelia burgdorferi* detection record is available; this does not establish pathogen absence.

04 **Social vulnerability**
The 2022 social vulnerability percentile is 89.3. Higher values indicate greater vulnerability on the source index. This is context for access and outreach, not proof of underreporting.

05 **Health insurance coverage**
The published percentage uninsured is 18.1%. This is context for healthcare access, not proof that cases are being missed.

06 **Rurality**
USDA Rural-Urban Continuum Code 9 (2023): completely rural or less than 2,500 urban population, not adjacent to a metro area. Code 1 is the most metropolitan and 9 is the most rural. This is context for follow-up planning, not a tick-habitat or underreporting measure.

Interpreting the data Lyme cases are assigned by county of residence, not necessarily the location of exposure. These data describe published surveillance, not individual risk. These values describe the published record. They do not show how much each field changed this county's gap score. The percentage uninsured is context; the score uses the uninsured percentile. A missing published case count is not an observed zero. Missing pathogen data is not a documented negative finding.

Observation periods: Lyme case records 2023; social vulnerability 2022; rurality 2023.

Review level unavailable

COUNTY DATA BRIEF | Dillingham Census Area, Alaska | Published gap-score response

Recommended posture This county is outside the contiguous tick scope of the current release, so a review level is not assigned. These rows are evidence-verification considerations, not a scored recommendation or an instruction to escalate surveillance.

Five suggested follow-up workstreams

Human disease surveillance	Check whether additional county case information is available through local surveillance records, including suppressed or unallocated reports. A missing published count is not a finding of zero cases.
Vector and pathogen surveillance	The published tick status is Unknown. This is not a finding of tick absence. Check whether newer local records change how that status should be read.
Clinical and laboratory reporting	Review local laboratory and clinical reporting pathways if available surveillance records suggest questions about case ascertainment. This is not a finding that laboratories failed to report.
Community context and outreach	Social vulnerability, health insurance coverage, and rural–urban classification are available as context. Consider whether existing prevention education reaches the communities those measures describe before adding outreach. They are not evidence of transmission or underreporting.
Coordination and documentation	Document which evidence is missing and identify possible sources for clarification. These notes support local verification. Atlas does not assign an owner, a deadline, or an escalation.

Questions before acting

01 Why is a follow-up category not assigned for this county?
02 Which published evidence is missing, limited, or outside the supported scope?
03 Are relevant state or local records available to clarify the evidence without assuming a particular response level?
04 Should these limitations be documented for routine review rather than treated as an assigned priority?
